

Software Tester (QA) – Assessment Response

Task Management Application

Full Name	Jiya Goyal
Email ID	jiya.goyal.cs.2023@mitmeerut.ac.in
Contact Number	8279734083

1. Test Case Design

I have considered normal use, wrong input and boundary cases for the main features of the application.

ID	Module	Type	Test case	Expected result
TC01	Registration	Positive	Enter valid name, email and password and click Register.	Account should be created successfully.
TC02	Registration	Negative	Use an email which is already registered.	Registration should not be completed and an error should be shown.
TC03	Registration	Negative	Leave any required field empty and submit.	The user should see a required-field message.
TC04	Registration	Negative	Enter an invalid email, for example abc@.	Invalid email should be rejected.
TC05	Registration	Negative	Enter a password which does not follow the required rules.	Registration should be blocked and the password rule should be shown.
TC06	Registration	Edge	Enter values at the minimum and maximum allowed length.	Valid boundary values should work and values outside the limit should be rejected.
TC07	Login	Positive	Enter correct email and password of a registered user.	User should log in and see the task features.
TC08	Login	Negative	Enter correct email with a wrong password.	Login should fail and an error message should appear.
TC09	Login	Negative	Enter an email which is not registered.	User should not be logged in.
TC10	Login	Negative	Keep email or password empty and click Login.	Required-field validation should be displayed.
TC11	Login	Edge	Enter email/password with extra spaces before or after the value.	System should handle the spaces correctly according to its validation rules.
TC12	Create Task	Positive	After login, enter valid task details and save the task.	Task should be created and shown in the task list.
TC13	Create Task	Negative	Leave a required task field empty and save.	Task should not be created and validation should appear.
TC14	Create Task	Edge	Enter task details at the allowed length limit and just beyond it.	Allowed values should work; invalid length should be rejected.
TC15	View Tasks	Positive	Open the task list after login.	The user's saved tasks should be displayed correctly.
TC16	View Tasks	Edge	Open the task list when there are no tasks.	A clear empty message should be displayed.
TC17	Edit Task	Positive	Open a task, change its details and save.	The updated details should be saved and displayed.
TC18	Edit Task	Negative	Remove a required value while editing and save.	Update should be rejected and a validation message should appear.

TC19	Delete Task	Positive	Select an existing task and click Delete.	Task should be removed from the list and the deletion should be saved.
TC20	Delete Task	Edge	Try to delete a task which is already unavailable.	Application should handle it safely without crashing.
TC21	Access Control	Negative	Log out and try to open a task page directly.	User should be denied access or sent back to Login.
TC22	Error Handling	Negative	If a server/database error happens while saving a task, check the response.	A clear error should appear and the task should not be falsely shown as saved.

2. Bug Identification / Risk Areas

These are possible bugs or risk areas based on the given features. They are not confirmed bugs because the application was not executed.

ID	Possible bug	Severity	Reason / Impact
BUG01	Same email can possibly be used to create more than one account.	Major	It can create duplicate accounts and login confusion.
BUG02	Registration may accept blank or invalid required information.	Major	Wrong or incomplete user data may be stored.
BUG03	Login may allow access with incorrect credentials.	Critical	An unauthorized person could get access to an account.
BUG04	A logged-out user may still open protected task pages.	Critical	Task information could be accessed without login.
BUG05	One user may be able to see or change another user's tasks.	Critical	This is a serious privacy and authorization problem.
BUG06	Create Task may show success even when the task is not saved in the database.	Major	The user may lose the task and the data can become inconsistent.
BUG07	Edit Task may change the screen but not save the change in the database.	Major	The user may think the change was saved when it was not.
BUG08	Delete Task may remove the task from the screen but not from the database.	Major	Deleted data may remain and cause inconsistent results.
BUG09	Very long or invalid task input may be accepted.	Minor	It can cause bad data or display problems.
BUG10	A database/server error may crash the application or show an unclear message.	Major	The user may not be able to complete the task and may not know the reason.

QA points considered: authentication, user access, input validation, database consistency and error handling.

Note: The assessment asks for potential bugs/risk areas without executing the application, so the bugs above are written as risks to verify during actual testing.
